Fundamentals of Heating and Cooling Loads - ASHRAE

The ASHRAE Heat Balance Method states that the " sum of all space instantaneous heat gains at any given time does not necessarily (or even frequently) equal the cooling load for the space at that same time ". Figure 2 attempts to convey this phenomenon by demonstrating the time delay associated with the 'Gains vs Loads' discussion.

ASHRAE Technical FAQ

In a cooling load estimate, heat gain from all appliances –elec- trical, gas, or steam –should be taken into account. Because of the variety of appliances, applications, schedules, use, and installations, estimates can be very subjective. Often, the only information avail- able about heat gain from equipment is that on its nameplate.

29.8 2001 ASHRAE Fundamentals Handbook (SI)

Simply put, heating and cooling loads are the rates of energy input (heating) or removal (cooling) required to maintain an indoor environment at a desired temperature and humidity condition. Heating and air conditioning systems are designed, sized, and controlled to accomplish that energy transfer. The amount of heating or cooling required at any particular time varies widely, depending on ...

Reprinted by permission from ASHRAE Journal, November, 1997 pp 37 - 45 For example, a ventilation air load index of 6.7 + 1.1 means that the total annual latent load is 6.7 ton-hours per cfm, and the annual sensible load is 1.1 ton-hours per cfm. The "VLI" is proposed in the same spirit that led to the use of the "degree-day" as shorthand for expressing heating and cooling loads on the ...

The Cooling Load Temperature Difference/Solar Cooling Load/ Cooling Load Factor (CLTD/SCL/CLF) load estimation method, used throughout Period Two, is a simplified hand calculation procedure developed long ago by ASHRAE. Because of its simplicity, it is the most common method used for basic instruction on estimating cooling loads.

ASHRAE Loads - Integrated Environmental Solutions Ltd

Cooling load is the rate at which sensible and latent heat must be removed from the space to maintain a constant space dry-bulb air temperature and humidity. Sensible heat into the space causes its air temperature to rise while latent heat is associated with the rise of the moisture content in the space.
