Domestic sewage treatment plants are designed to treat and clean your wastewater using the innovative fixed bed process that allows the bacteria to grow and to degrade the pollution from the effluents. The fixed bed is powered by oxygen that is supplied via the compressor. It requires less energy to run than a lightbulb, keeping costs at a minimum.

The treatment process of the wastewater is that the domestic wastewater and more passes through the system from housing developments into the sewage treatment plant. Here, the sewage treatment plants begin to break down the organic matter through its activated sludge process – ultimately producing sewage effluents.

From here on, gravity takes over to move the wastewater through the treatment process. 3. Aerating. One of the first steps that a water treatment facility can do is to just shake up the sewage and expose it to air.
